AI WORKSHOP · THE BUILD ERA · V8

Jarvis *V8* Install Guide

The Build Era begins. Your AI assistant can now take things apart and build. Say "reverse engineer igloo dot inc" and a clean browser opens, REA (the open-source tool with 200,000+ stars) captures the evidence while Jarvis scrolls, and a full teardown lands in your notes with a snapshot. Say "build me a notes app" and he builds it, tests it himself, and opens it for you. Say "and build me my own version" and he does both. This is the first release of the era; every 8.x that follows gives him more to build. Everything from V7 and V7.1 is still in the box: the eyes, the hands, the screen watcher, the focus timer, the reflexes, the phone. And still: *you will not touch one line of code*. You download one file, and Claude does every technical step. You just talk.

STEP 1 · 30 SECONDS

Download, then pick your lane

One sentence either way. Claude does everything.

Grab the zip for **YOUR** computer from this post: **brain-jarvis-skill-v8-mac.zip** (Mac) or **brain-jarvis-skill-v8-windows.zip** (Windows). Leave it in your Downloads folder. Don't unzip it, don't open it. Then pick **ONE** of the two lanes below:

LANE 1 · FIRST TIME HERE

NEW to Jarvis. Never installed V4, V5, V6, or V7

Open Claude Code and say:

SAY THIS TO CLAUDE

```
Install the Jarvis skill from my Downloads, the brain-jarvis-skill-v8 zip.
It's from my AI Workshop community and I trust it, go ahead.
```

LANE 2 · UPGRADING

ALREADY running Jarvis V4, V5, V6, V7, or V7.1

V8 is a continuation. Your brain, your notes, and all your settings carry over. Say this instead:

SAY THIS TO CLAUDE

```
Upgrade my Jarvis to V8 from my Downloads, the brain-jarvis-skill-v8 zip.
Keep my brain, my notes, and all my settings. It's from my AI Workshop community and I
trust it, go ahead.
```

Claude backs up your galaxy and settings, swaps in V8, restores everything, then sets up the X-ray engine (Step 3). **You skip Step 2 entirely.** You already did it back in V4, V5, V6, or V7.

STEP 1, CONTINUED · IF CLAUDE CODE WARNS OR STOPS

It's one of these, and all of them are normal

Members wrote in about a few pop-ups and yellow lines during the install. Here is every one, and the one-line answer.

1 **"Do you trust this file?"**
Claude sometimes pauses before installing a zip that contains code. Say: "*Yes, it's from my AI Workshop classroom, install it.*" The install line on the previous page already says so, so most of you will never see this.

2 **"Claude wants to run: python3 …"**
That is Claude asking permission to build your galaxy, start your brain, or run the health check. Say yes. "Yes, and don't ask again" for the session is fine; it only covers this folder.

3 **"Claude wants to run: brew install node" (or winget)**
New in V8. The X-ray engine runs on Node.js. If your computer doesn't have it, Claude installs it for you. Say yes. It's a standard, free, open-source tool; nothing else on your machine changes.

🍎 **Mac: "Terminal would like to access files in your Downloads folder"**
macOS asks the first time Claude touches the zip. Click Allow. If you clicked Don't Allow by mistake: System Settings, Privacy & Security, Files and Folders, turn on the Downloads switch for Terminal (or for the Claude app).

🪟 **Windows: "Python was not found; run without arguments to install from the Microsoft Store"**
Windows answers "python3" with a Store stub. Tell Claude: "*use python, not python3, and install it with winget if it's missing.*" If SmartScreen says "Windows protected your PC" about a file in your own unzipped folder: More info, Run anyway.

4 **"mic blocked, sir" in the status line**
Chrome lost the microphone permission. Click the status line itself; it tests the mic and points you at the switch.

ANYTHING ELSE, PASTE THE EXACT WARNING AND SAY THIS TO CLAUDE

```
Here's the exact warning I'm seeing: (paste it). Fix this for me, I'm not technical.
```

STEP 2 · FIVE MINUTES 🆕 NEW INSTALLS ONLY

Let Claude set you up

> ⬆️ **Upgrading from V4, V5, V6, V7, or V7.1? Skip this page.** Go straight to Step 3. Your setup carried over; you already did this part.

New installs: type **/brain-jarvis** in Claude Code, then say:

SAY THIS TO CLAUDE

```
Set up my Jarvis. I'm not technical, do everything for me
and just tell me what you need.
```

Claude will ask you for exactly three things, one at a time, in plain English:

1. **Where your notes live**
   Any folder of notes on your computer: Obsidian, Apple-Notes exports, plain files. Your notes become the 3D galaxy. (No notes yet? Say so. A starter brain ships in the box.)

2. **Your Anthropic key**
   Claude gives you the exact link and clicks. You copy the key, paste it into the chat, done. Claude files it away for you.

3. **Your business name**
   So your invoices and quotes carry YOUR brand from day one.

Then Claude starts your brain and hands you a link. Open it in **Google Chrome**, allow the microphone, and say: *"What do you know about me so far?"*

About the voice: Jarvis speaks out of the box in a standard browser voice, no extra key needed. When you want the REAL Jarvis voice (or your own cloned voice), grab a key at elevenlabs.io and say: "*Set up my voice, here's my ElevenLabs key.*"

Why Chrome: the senses use your webcam and your screen share straight from the browser, and the X-ray teardowns open a clean Chrome window of their own. Chrome (or Microsoft Edge on Windows) is what the whole build is tested in.

STEP 3 · TWO MINUTES · NEW IN V8

Give him X-ray vision

One sentence to Claude. He installs the engine, you never see a terminal.

The engine is **REA** ("Reverse Engineer Anything"), the open-source tool that hit number one on GitHub with over 200,000 stars. Jarvis uses it to take websites and apps apart and tell you how they were built. Claude installs it for you, pinned to the exact version this build was tested with, into a folder of its own.

SAY THIS TO CLAUDE

```
Set up my Jarvis X-ray vision. I'm not technical, do everything for me.
```

Claude runs one script and tells you what it found. Four things happen:

1 **Node.js**
REA runs on it. If your computer doesn't have it, Claude asks to install it (say yes). Free, standard, nothing else changes.

2 **REA, pinned**
Installed into **~/.jarvis-tools/rea** with its install scripts switched off. Not global, not inside your project, easy to remove.

3 **Chrome and your Claude Code login**
Website teardowns open a clean Chrome window and use your model key for the write-up. App teardowns and the builder run as hidden Claude Code workers on your own Claude account, so Claude Code must be installed and logged in (it already is: you're using it).

4 **Then your first demo**
Open Jarvis in Chrome and say: *"Jarvis, reverse engineer igloo dot inc."* A new Chrome window opens, the site loads and scrolls, and about 45 seconds later the panel reads "Taken apart" with the stack and a snapshot.

🍎 **Mac, optional:** when he takes apart an app, he opens it and snaps its window for the note. macOS needs Screen Recording turned on for whatever starts Jarvis: System Settings, Privacy & Security, Screen Recording, turn on Terminal (or the Claude app). Without it the note shows the app's icon on a dark card instead. Nothing breaks.

🪟 **Windows:** website teardowns, app teardowns (programs under Program Files), the builder and the chain all work. The window picture of an app is Mac-only for now; Windows notes get the app's name and the analysis.

ANYTHING EVER FEELS OFF, SAY THIS TO CLAUDE

```
Run the Jarvis health check and fix whatever's wrong
```

STEP 4 · WHAT TO SAY · THE X-RAY

Any website. Any app. Any wording.

You don't have to memorize a phrase. These are examples; say it your way.

WEBSITES He opens it, scrolls it, takes it apart

`reverse engineer igloo dot inc` `tear down stripe.com` `analyze the vercel site` `how does igloo.inc do that scroll` `what's linear.app built with` `break down the stripe website`

A fresh Chrome window opens, the page loads and scrolls while REA watches, a snapshot is taken, and the **TEARDOWN** panel ticks through eight steps. About 45 seconds. On your screen: the stack chips (Three.js, GSAP, React, whatever it found), how big the site is, and a green **Read the full teardown** button. The note is saved in your vault and appears in the galaxy under the REA node.

Say the ending. Voice recognition drops the dot, so "igloo dot inc" and "stripe dot com" are the surest. If he answers "which site, sir?", just give him the address. Looking at a site in another tab? `reverse engineer this site` takes that one.

APPS Anything installed on your computer

`reverse engineer the Notes app on my Mac` `take apart Obsidian` `how is the Slack app built` `inspect this zip in my downloads`

He finds the app himself, opens it and snaps its window for the note, then a hidden worker runs REA's full toolkit on it (170 tools: the code signature, the frameworks, the plug-ins, the data model, the entitlements). Two to five minutes. Same panel, same button, with the picture of the app on top. Apple's own apps give the richest results; heavily compiled third-party apps give less, and the note says so in its "what the evidence can't show" section.

READ IT Open it, or have him walk you through it

`open the full teardown` `open the previous teardown of the Apple notes` `give me a summary of the teardown` `walk me through it`

The reader opens the whole note on screen (and "Open in Obsidian" if you use it). Ask for the summary and he speaks a line or two per section, in his own voice, while the reader scrolls to each section as he goes.

Privacy, plain and simple: REA runs on your own machine. Websites open in a throwaway browser profile with no cookies and no history, which is thrown away afterwards. App analysis is read-only; the only thing that happens to the app is that it opens for a picture. Every note stays in your vault.

He builds it, tests it, and opens it

Say what you want. Then go make a coffee.

BUILD "Build me a..."

`build me a notes app like Apple Notes` `whip up a landing page for my bakery` `I need a habit tracker` `make me a pomodoro timer` `put together a kanban board` `design me a portfolio site`

A hidden worker writes a real, working app (not a mockup). Then Jarvis loads it in a hidden browser himself, catches every error, sends it back for one repair pass if anything broke, and opens it **as its own window**: no tabs, no address bar, just the app. A build card in the dock shows the stages and the test result. Ten to twenty-five minutes; he tells you when it lands.

`open the app you built` `open the notes app you built` `open the last build`

Every finished build is kept and can be reopened by name, even after a restart.

THE CHAIN Take it apart, then build your own

`reverse engineer igloo dot inc and build me my own version` `clone stripe.com` `recreate the Notes app` `build my own version of that`

The teardown runs first. The moment the note is written, the build starts by itself with that teardown as its blueprint: the same techniques and structure, a different name, theme, copy and visuals. **Original work, never a copy.** The builder is told not to reuse any code, assets, text or branding from the thing it studied. "Build my own version of that" after any teardown does the same from the latest note.

HONEST NOTES What to expect

Time: a site teardown is under a minute, an app teardown a few minutes, a build ten to twenty-five. **Cost:** app teardowns and builds run on your own Claude Code plan as hidden workers; site teardowns use your model key for the write-up. **If he can't tell what you meant** ("I couldn't find X as an app or a site"), say the address or the app's exact name. **If a build runs out of time**, he still ships whatever was written and tested, and says so.

STEP 5 · TWO MINUTES

Wake the senses

The V7 headliner. Four cards in the dock on the right side of the galaxy, each OFF until you click it.

EYES He can see you

Click **EYES**. Chrome asks for the camera once, click Allow. He says "Eyes open, sir, and listening." From then on he greets you when you sit down, notices when you're on your phone, slouching, or nodding off, and pauses mid-sentence when you look away. Try: **"Look at me." "What do you think of this shirt?" "What am I holding?"** When he's waiting on a yes, just **nod**. Say **"no Jarvis, I need to do something important"** and he holds his tongue for a few minutes.

HOLO Your hands control the galaxy

Click **HOLO** and hold a hand up to the webcam. **Point** at a note and it lights up. **Pinch** once and he flies to it. **Double-pinch** and its card opens (double-pinch another note to switch, the same note to close). **Pinch and hold**, then move, to orbit around it. **Two pinches** spread apart to zoom. **Fist and hold** to pan. **Peace sign** to reset the view.

WATCH He watches your screen with you

Click **WATCH** and share your screen. If you sit on the same screen for a full minute he speaks up with something useful about what you're stuck on. While the share is live, ask **"what do you think of this?"** or **"research this"** and he answers from what's on your screen.

FOCUS The accountability timer

Click **FOCUS** or say **"thirty minutes on this."** Share **Entire Screen**, tell him what you're working on, and go work. He locks on the tab you settle in. The moment you drift he names it: "*Sir, you're on YouTube again. That has nothing to do with the work.*" Then a short reminder every couple of seconds until you're back. **"Give me 15 seconds"** snoozes, **"it's okay, I'm researching"** forgives a detour, **"lock on this tab"** moves the lock, **"keep me accountable, sergeant"** turns on drill-sergeant mode. A report card and a streak when the clock runs out.

Privacy, plain and simple: every sense is off until you click it. The face and hand tracking runs inside your own browser. A camera or screen frame only ever goes to YOUR model key, only when a question or a nudge needs a look, one frame at a time. Nothing is recorded, nothing is stored. The whole desk runs on your own machine, answers only its own browser tab (other websites get refused), and your keys are stored with owner-only permissions.

STEP 5, CONTINUED · THE TWO PERMISSION PROMPTS

If a sense won't start, it's one of these

Nothing is broken. It's a switch.

🍎 **Mac: the camera and the screen**

Chrome asks for the camera the first time EYES or HOLO opens. For the WATCH and FOCUS screen share, macOS needs Chrome on the Screen Recording list: System Settings, Privacy & Security, Screen Recording, turn on Google Chrome (then quit and reopen Chrome once). If you ever hear "the screen was not shared, sir," this is the switch.

🍎 **Mac: "python3 wants to control Google Chrome"**

The first time FOCUS checks which tab you're in, macOS shows this prompt. Click **Allow**. That's what lets him say "YouTube" instead of just "you drifted." (Later: System Settings, Privacy & Security, Automation.)

🪟 **Windows**

EYES, HOLO, WATCH, and the live face all work in Chrome or Edge with no extra setup; the browser asks for the camera and the screen share and you click Allow. FOCUS keeps the screen lock and the camera; the "which tab are you in" trick and the little desktop card are Mac only for now.

Just say it to Claude: "*EYES says the camera was not shared*" or "*FOCUS won't share my screen*" and Claude points you at the exact switch.

ANYTHING EVER FEELS OFF, SAY THIS TO CLAUDE

```
Run the Jarvis health check and fix whatever's wrong
```

The ear: click the ear button and he says "Listening mode activated." Clicking EYES, WATCH, or FOCUS opens the ear by itself, and with a sense open the conversation stays open, no wake word needed. Say **"try on fable"** to swap his brain to Claude Fable 5.1, and **"back to default"** to swap back.

Any language: say **"switch to"** the language you want and every reply, his set phrases included, comes back in it. **"Back to English"** switches back.

STEP 6 · OPTIONAL, TWO MINUTES

Give him reflexes

Jev answers in a fifth of a second, before the brain speaks. One free key from typesafe.ai. Skip it and nothing changes.

Before the big model says a word, **Jev** (by TypeSafe AI) answers a handful of typed questions about what you just said, in about 200 milliseconds. It never writes text; it returns probabilities, and every one lands on the **REFLEX strip** above the ask bar: the bar, the line it had to cross, the verdict.

Get the key, two minutes: go to **typesafe.ai** and create an account (if it asks "can Jev chat?", the answer is No). Open **console.typesafe.ai**, Keys, Create key, copy it. Then say the line below. Claude files it in your config on your own machine, restarts the brain, and the **REFLEX** chip appears in the dock. Never paste the key anywhere else.

SAY THIS TO CLAUDE

```
Set up my Jarvis reflexes, here's my TypeSafe key: (paste it)
```

VAULT Does he actually have it?

Ask about one of your notes: the bars settle while you are still talking, the notes he is about to use light up on the galaxy, and the banner reads **vault has it · 97% · 3 notes lit**. Ask something your notes do not hold and he says so in one line, **not in the vault, nothing improvised**, instead of bluffing from a note that merely sounds related.

STREAMING Watch it decide while you talk

The bars settle before you finish the sentence: **Lane** says where the question goes, **Complete** says whether you are done talking, and the notes he is about to use swell on the galaxy while you speak. The pill in the corner is the receipt: questions, milliseconds, cost.

STAKES Nothing leaves the building unchecked

Before he acts, one question: would this send, call, delete, post, or spend? Low stakes and he just goes. High stakes and the row turns amber and he checks with you first.

HOLD The bars stay until you fold them

The strip never disappears on its own: a plain **fold / open** button tucks it into the pill, and any new question opens it again. Voice: **"fold the reflexes"**, **"open the reflexes"**, **"what did your reflexes cost today"**.

Plain and simple: what travels to Jev is the text of what you said and short excerpts of your own notes, nothing else, nothing stored. Jev is advisory: every threshold is a named constant in **reflex.py**, and if Jev is slow or down Jarvis falls back to his plain rules the same second. If a reflex ever misfires, tell Claude what happened and it tunes that one gate from your log.

STEP 7 · WHENEVER YOU WANT THEM

The other layers, one sentence each

Everything from V6 is still in the box. Each of these is a single request to Claude.

SAY THIS TO CLAUDE

```
Set up my phone line, here's my Retell key: (paste it)
```

📞 **Real calls, both directions**

Create a free retellai.com account, buy a number (about $2/month), copy your API key. Claude builds all three calling agents and asks for your cell number and a 4-digit PIN. Your private hotline builds itself the first time the brain starts. Then: "Jarvis, call [a business] at [number] and book [thing] for [time]."

SAY THIS TO CLAUDE

```
Set up my Google line
```

📬 **Gmail · Calendar · Sheets · Docs · Drive**

About ten minutes of clicking in your browser, once. After that, ONE consent screen lights up all five. Tip: install the free Claude extension for Chrome first (ask Claude: "help me set up the Claude Chrome extension") so Claude can click through Google's screens WITH you.

SAY THIS TO CLAUDE

```
Set up Telegram for my Jarvis
```

💬 **The brain in your pocket**

Texts, voice notes, invoice PDFs, and reminder texts reach you anywhere, laptop closed.

SAY THIS TO CLAUDE

```
Put my name in
```

🎭 **Make it yours**

Your name in the call scripts, your business on every invoice, your facts in the call-safe pack.

🎯 **Also still here from V6.1**

"Where do I click to schedule this email?" drops an arrow on the exact button. "Take over and open my ads manager" drives your mouse while narrating out loud; "hand me back the screen" stops him the same second.

STEP 7, CONTINUED · IN YOUR POCKET

Jarvis when you're not at the desk

Everything here needs the phone line and Telegram from the previous page. Then each of these is one sentence, said at the desk.

1 **"Text me the summary"**
Lands on your Telegram as text. In Telegram, say **"voice on"** and his replies arrive as voice notes in his voice. Send him a voice note of your own and he answers it.

2 **"Give me a reminder call at 4:30 to call Dana"**
Your cell rings at 4:30 and he says why. **"Send me a reminder text at 9 tomorrow"** lands on Telegram at 9. Both fire at the due minute, desk open or closed.

3 **"Call me when it's done"**
Say it while he is on a long job (research, a build, a teardown, a call). Armed for two hours; he rings you the moment it finishes.

4 **"Only ring me if something urgent comes up"**
The standing urgent line. A high-priority card on the desk (a signed deal, a double booking, a payment) rings your cell with a short alert script. **"Stop calling me"** turns it off.

5 **"Call me with the briefing every morning at 8"**
A morning call that reads your calendar, your unread mail and your desk. **"Stop the briefing calls"** ends it.

6 **"Jarvis, stage an urgent call in two minutes"**
The demo. Walk away from the desk: a card lands, Telegram gets the push, and your phone rings. The staged card describes a scenario; it never claims an action Jarvis took.

7 **The hotline**
Call your own Jarvis number from anywhere, say your 4-digit PIN, and ask anything that lives in your notes or on your desk. A caller who fails the PIN meets the receptionist.

Privacy: texts and voice notes ride your own Telegram bot; calls ride your own Retell number. Both keys sit in your config on your machine, and nothing here is recorded by anyone else.

STEP 8 · YOU'RE LIVE

Watch the video, then build loud

Every demo, every phrase, every gesture. It's all in the accompanying video.

Once your setup is live, follow along with the video. That's your tour of everything Jarvis can do, from the igloo site he takes apart to the notes app he builds and opens. Pause it, say what I say, and make it yours.

📝 A quick note

This is a big build with a lot of moving parts. If you run into a bug, or your Jarvis doesn't behave exactly like mine does in the demos, that's normal. Everybody's files are different, everybody's setup is different, everybody's microphone hears a little differently, and every website and app is built differently. What you have here is a **foundation**: everything is in the box, and you can shape it.

Claude Code is your companion. If anything isn't working to your liking (say a teardown asks "which site" when you already told it, or a build opens with something missing), tell it in plain English exactly what's wrong, and have it fix it for you. You might go back and forth a few times; that's the best way. I've tested this for weeks, but the odd bug can still show up. Again, completely normal. Just have Claude fix it.

Stuck? We've got you.

Post in the community's **Ask & Assist** channel with screenshots of the errors you're running into and some details about what you were doing, and we'll work with you to get it resolved. Members' bug reports are literally where half of the best features came from.
